

Sealing by Spray Film

Spray film is a solventless 2-component-polyurea-elastomer spray film. Once cured, it possesses elastomer qualities, which it retains even at low temperatures.

The spray film can only be applied by a 2-component-spray plant due to its high reactivity. The chemical reaction takes place within a few seconds.

The coating in accordance with the water protection laws is suitable as flexible coating of statically adequate protection constructions in old and new buildings as well as for above ground retention ponds and for water pools.

It will withstand diesel and heating oil, petrol, alkaline solutions etc.

Also, it is ideal as a seal against water in cracked structures or in structures that are in danger of cracking, such as flat or cupola roofs, patios, balconies, pipes, clarifiers etc.

Application as bridge seal in accordance with OS 10.
